

FAL	Learning Objective	Insufficient <6	Sufficient 6_6.5	Good 7_7.5_8	Very Good 8.5_9	Excellent 9.5 _10
1,4,6	Lo1 Develop and rationalise a design or research challenge, and iteratively refine it in response to evolving insights	The design/research challenge is unclear, unsupported, or contextually inappropriate. Reasoning is absent or inaccurate. There is no meaningful evidence of iterative development or responsiveness to insights.	The design/research challenge is formulated in basic terms, and minimal rationale is provided. Some iteration is present, connecting insights and updates to the challenge.	The design/research challenge defines a coherent and appropriate scope with a sound rationale. Evidence of iteration is present with incremental refinements justified.	The design/research challenge is clear and highly relevant with a convincing rationale. Purposeful iteration, refining the challenge in response to new insights and feedback is evident.	The design/research challenge is well-scoped and supported by a rigorous and critically informed rationale. The challenge has undergone sophisticated iterative refinement, with updates clearly driven by deep reflection and emerging insights.
2,3,5	Lo2 Select, justify, and apply appropriate research and/or design methods to the defined challenge to enable the generation of novel, credible, and actionable outcomes.	Methods are not specified and/or incorrectly applied, and/or do not support the project context.	Methods are appropriate, but their selection and/or application does not show explicit attention to the defined challenge and potential outcomes.-	Methods are selected and justified with respect to the defined challenge, and with consideration of foreseen outcomes. Analysis and synthesis largely follow these methods.	A coherent, context-appropriate, and triangulated set of methods is selected and applied with transparency and awareness of limitations with respect to the defined challenge and foreseen outcomes. Analysis and synthesis robustly follow these methods.	The methodology is novel, rigorously constructed, independently executed, and critically reflected upon with respect to the defined challenge and explicitly aimed at producing high-quality outcomes.
3,4,11	Lo3 Generate, develop, and iteratively improve design/research concepts or strategies through appropriate prototyping and testing.	Concepts are underdeveloped, unjustified, or disconnected from research insights. Prototyping or testing (if present) does not inform design decisions.	Concepts are conventional. Prototyping and testing offer guidance for incremental improvements	Concepts are largely justified and aligned with the project context. Prototyping and testing contribute to development, though iteration holds potential for further exploration.	Concepts are creative, credible, and strongly justified. Prototyping and testing are systematic and clearly inform design decisions, resulting in meaningful refinement.	Design outcomes are exceptionally coherent, original, and well-developed. Prototyping and testing are rigorous, iterative, and insightful, producing outcomes that approach implementable fidelity.
2,8,11	Lo4 Fulfil the design/research challenge by producing outcomes that enable possible, responsible, and sustainable futures.	The primary design or research challenges / knowledge gaps are not fulfilled. Possibility and sustainability are largely unaddressed or absent.	The project outcome addresses the challenges and/or knowledge gaps. Considerations of possibility, responsibility and sustainability are present yet basic or superficial.	The project outcome convincingly addresses key challenges and/or knowledge gaps. Possibility, responsibility and sustainability are addressed appropriately, considering the project context.	The project outcome comprehensively addresses the challenges and/or knowledge gaps. Possibility, responsibility and sustainability are explored in depth and extend meaningfully beyond the immediate project context.	The project outcome comprehensively addresses the challenges and/or knowledge gaps to create value beyond the scope of the project. Possibility, responsibility, and sustainability are addressed in ways that create guidelines or instruction for future work.
6,7,9	Lo5 Manage and deliver the project on time while professionally navigating the associated complexities of collaboration and ethics	Project management is poor, with limited or ineffective collaboration. Significant reliance on supervisors is evident. Ethical awareness is absent.	Project management is evident, with the project completed with some delays. Some supervisory support is required for key decisions and/or ethical considerations. Limited stakeholder engagement is demonstrated.	Project management is coherent, delivered in a nominal time and with appropriate collaboration. The students demonstratessndependent and responsible decision making. Key stakeholders are approached and engaged.	The project is delivered in nominal time and proactively managed with strong awareness of ethical considerations. The student shows clear autonomy and effective stakeholder engagement.	Project management is highly professional and proactive. Strong ethical agency and exemplary collaboration create new stakeholder relationships and/or networks. The project is delivered in nominal time.
7,10	Lo6 Communicate process, insights, reasoning, and outcomes consistently and effectively through written, visual, and verbal modalities	Writing is unclear, visuals are disorganised, and arguments are incoherent. Presentations are very difficult to follow and do not convey the project meaningfully.	Writing and visuals are mostly consistent with instances of structure across written, visual, or verbal modes. Presentations are somewhat clear but can benefit from stronger structure.	Writing and visuals clearly convey the project. The narrative is largely structured, the academic tone is appropriate, and presentations are well-prepared and coherent.	Communication is confident, clear, and professional. Writing approaches publishable quality, and the narrative is well structured. Visual materials and verbal presentation are effective and well-integrated.	Communication is confident, clear, coherent, and aesthetically refined. The quality warrants scientific or professional publication. Excellence is sustained across written, visual, and verbal modes, supporting seamless, compelling argumentation.
6,7	Lo7 Reflect on the project outcome from the perspective of academic standards, professional practice. (see initial Project Proposal)	Reflection is absent, minimal, or purely descriptive. The student does not recognise academic standards or professional expectations, nor relate them meaningfully to the project outcome.	Reflection is present but superficial. The student shows limited awareness of academic standards or professional practice, and connections to the project outcome are vague, generic, or incomplete.	Reflection is well-developed, with clear reference to relevant academic standards and professional practices. The student demonstrates appropriate self-awareness and can relate these considerations to the project outcome.	Reflection is thoughtful, well-structured, and critically engages with academic standards and professional expectations. The student articulates how these considerations shaped the project outcome and identifies specific areas for further development.	Reflection is sophisticated, integrative, and insightful. The student demonstrates a deep understanding of academic standards and professional practice, critically evaluating the project outcome with nuance and foresight. Reflection reveals mature professional judgment and identifies pathways for advancing practice.

FAL	Thematic	Bloom Level	Learning Objective
1,4,6	Design framing and rationale	Analyse, Evaluate and Create	Lo1 Develop a plan and rationale for the project by defining and underpinning design challenges and/or knowledge gaps, and update these as

			needed based on evolving insights.
2,3,5	Research capability and insight generation	Apply, Analyse and Evaluate	Lo2 Select, justify, and apply appropriate research methods to the defined challenge in order to generate novel, credible, and actionable insights.
3,4,11	Knowledge integration, synthesis and making	Analyse, Evaluate, Create	Lo3 Generate, develop, and iteratively improve design/research concepts or strategies through appropriate prototyping and testing.
2,8,11	Designing sustainable, just and impactful outcomes	Apply, create and evaluate	Lo4 Address the design /research challenge by producing outcomes that enable possible, responsible, and sustainable futures.
6,7,9	Professional identity, reflexivity and agency	Evaluate and Create	Lo5 Deliver the project on-time while professionally managing the associated complexities of collaboration and ethics
7,10	Communication across modalities	Apply, Analyse and Create	Lo6 Communicate process, insights, reasoning, and outcomes consistently and effectively through written, visual, and verbal modalities
6,7	Reflection	Evaluate	Lo7 Reflect on the project outcome from the perspective of academic standards and professional practice.

FALS:

1. An IDE graduate is able to explore, select and adopt design practices by critically integrating them in their own process and by adapting them to diverse contexts.
2. An IDE graduate is able to build a strong design rationale based on design reasoning and informed by academic research and/or self-conducted design research and in reference to possible, sustainable and just futures.
3. An IDE graduate is able to integrate knowledge relevant to the design challenge into design concepts.
4. An IDE graduate is able to explore the unknown and show creativity in framing, conceptualising and prototyping design outcomes, i.e., strategies, interventions or products and product-services.
5. An IDE graduate is able to understand, independently plan and conduct academic research to generate new knowledge for, about, or through design.
6. An IDE graduate is able to autonomously acquire and judge relevant contemporary disciplinary knowledge relevant for design, and demonstrates this as common practice needed for life-long learning.
7. An IDE graduate is able to position themselves in a professional context and demonstrate confidence, reflexivity, and agency in acting within it.
8. An IDE graduate is able to analyse, discuss, and anticipate the role of design at different individual, organisational, societal and planetary levels and in reference to their interactions.
9. An IDE graduate is able to work collaboratively, ethically, and inclusively within and across disciplines and stakeholders.
10. An IDE graduate is able to communicate professionally in writing, visually and verbally about research outcomes and design solutions.
11. An IDE graduate can develop and evaluate design outcomes/directions/proposal to the level of detail that implementation can be carried out.
